Tests: (3) SARS COV 2 AB (IGG) SPIKE, SEMI QN (34499SB=)

! SARS COV 2 AB (IGG) SPIKE, SEMI QN

<1.00 index	<1.00	*36
-------------	-------	-----

Reference Range

INDEX	INTERPRETATION
<1.00	Negative
> or = 1.00	Positive

This test is intended to help identify individuals with antibodies to SARS-CoV-2 (COVID-19). The results of this semi-quantitative test should not be interpreted as an indication or degree of immunity or protection from reinfection.

A test result that is 1.00 or more (Positive) means antibodies to SARS-CoV-2 were detected in the blood sample by the test. This could mean that the individual may have an immune response to a recent or prior infection with SARS-CoV-2. Positive results may occur after COVID-19 vaccination, but the clinical significance of a positive antibody result for individuals that have received a COVID-19 vaccine is unknown, and the performance of the test has not been established in COVID-19 vaccinees. False positive results for the test may occur due to cross-reactivity from pre-existing antibodies or other possible causes.

A test result that is less than 1.00 (Negative) means that antibodies were not detected in the blood sample by the test. This could mean that the individual has not been previously infected with SARS-CoV-2. The clinical significance of a negative antibody result for individuals that have received a COVID-19 vaccine is unknown. The performance of the test has not been established in

COVID-19 vaccinees. False negative results for the test may occur if the individual's antibodies have not reached a sufficient level for the test to be able to detect them. Antibodies can take up to two to three weeks (sometimes longer) to develop after someone is infected. How long antibodies to SARS-CoV-2 last after infection is not known.

This test should not be used to diagnose an active SARS-CoV-2 infection. If an active infection is suspected, direct molecular or antigen testing for SARS-CoV-2 is recommended.

Please review the "Fact Sheets" available for healthcare providers and patients using the following websites:
<https://www.QuestDiagnostics.com/home/Covid-19/HCP/antibody/fact-sheet8>

<https://www.QuestDiagnostics.com/home/Covid-19/Patients/antibody/fact-sheet8>

Healthcare Providers: For additional information please refer to:

<http://education.questdiagnostics.com/faq/FAQ219>
(This link is being provided for informational/educational purposes only.)

This test has been authorized by the FDA under an Emergency Use Authorization (EUA) for use by authorized laboratories. The FDA authorized labeling is available on the Quest Diagnostics website:
www.QuestDiagnostics.com/Covid19.

Tests: (4) HEPATITIS B CORE ANTIBODY (IGM) (4848SB=)
HEPATITIS B CORE ANTIBODY (IGM)

HEPATITIS C ANTIBODY	NON-REACTIVE	NON-REACTIVE	*38
INDEX	0.02	<1.00	*39

HCV antibody was non-reactive. There is no laboratory evidence of HCV infection.

In most cases, no further action is required. However, if recent HCV exposure is suspected, a test for HCV RNA (test code 35645) is suggested.

For additional information please refer to

Index	Interpretation
-----	-----
<0.90	Not consistent with immunity
0.90-0.99	Equivocal
> or = 1.00	Consistent with immunity

The presence of rubella IgG antibody suggests immunization or past or current infection with rubella virus.

Tests: (7) VARICELLA ZOSTER VIRUS ANTIBODY (IGG) (4439SB=)
VARICELLA ZOSTER VIRUS ANTIBODY (IGG)

	1635.00 index	*41
Index	Interpretation	
-----	-----	
<135.00	Negative - Antibody not detected	
135.00 - 164.99	Equivocal	
> or = 165.00	Positive - Antibody detected	

A positive result indicates that the patient has antibody to VZV but does not differentiate between an active or past infection. The clinical diagnosis must be interpreted in conjunction with the clinical signs and symptoms of the patient. This assay reliably measures immunity due to previous infection but may not be sensitive enough to detect antibodies induced by vaccination. Thus, a negative result in a vaccinated individual does not necessarily indicate susceptibility to VZV infection. A more sensitive test for vaccination-induced immunity is Varicella Zoster Virus Antibody Immunity Screen, ACIF.

Tests: (8) RPR (DX) W/REFL TITER AND CONFIRMATORY TESTING (36126SB=)
RPR (DX) W/REFL TITER AND CONFIRMATORY TESTING

173 pg/mL *65

Inhibin A MoM

1.33 *66

! COMMENTS:

*67

RESULT: This patient's EDD (estimated date of delivery) was used to calculate the gestational age.

Performance of maternal serum AFP, hCG, estriol, and dimeric inhibin A provides a useful screening test for detection of open neural tube defects and some chromosomal abnormalities. It should be noted that normal results can never guarantee the birth of a normal baby and that 2 to 3 percent of newborns have some type of physical or mental defect, many of which are undetectable through any known prenatal diagnostic technique.

! 55210380 <No Reported Value> *68

This is a screening test, not a diagnostic test. No

reagent system establishing the risk of chromosome abnormalities during pregnancy has been approved by the FDA. This risk assessment report is based in part on demographic data provided by the ordering physician. It has been observed that patients who smoke cigarettes during pregnancy may have a slightly increased risk of having a false positive MSS screen for Down syndrome or trisomy 18. It has been observed that patients whose pregnancy is the result of IVF may have a slightly increased risk of having a false positive MSS screen for Down syndrome or trisomy 18. Please notify the laboratory promptly if any data are incorrect. For assistance with recalculations, please call your local Quest Diagnostics laboratory. For assistance with interpretation of these results, please contact your local Quest Diagnostics genetic counselor or call 1-866-GENEINFO(436-3463).

Interpretive Cut-offs

Screen Positive For Open NTD: > or = 2.50 adjusted MOM
 > or = 1.90 adjusted MOM for
 Insulin-dependent diabetics
 > or = 4.00 adjusted MOM for
 Twins
 > or = 3.50 adjusted MOM for
 Twins insulin-dependent
 Diabetics
 > or = 4.50 adjusted MOM for
 Triplets

Screen Positive For Down Syndrome: "MSS Down Syndrome Risk"
 that equals or exceeds
 1 in 270

Screen Positive For Trisomy 18: "MSS Trisomy 18 Risk" that
 equals or exceeds 1 in 100

EXPLANATORY NOTE:

The Pap is a screening test for cervical cancer. It is not a diagnostic test and is subject to false negative and false positive results. It is most reliable when a satisfactory sample, regularly obtained, is submitted with relevant clinical findings and history, and when the Pap result is evaluated along with historic and current clinical information.

Technique

Transverse, sagittal and doppler imaging was performed with a curvilinear transducer through a physiologically distended bladder.

Physician Review

Conclusions: 1. No fetal, placental, uterine or adnexal abnormalities observed.

Findings: A single live IUP seen measuring 21.14weeks with an EDD of 02/01/2022. The fetal presentation is . The fetal heart rate is 155bpm and an EFW of 377g based on ultrasound measurements. The placenta is seen in the anterior position, without evidence of previa. The fetal anatomical survey is grossly unremarkable for abnormalities.
